This tree is a supportless and bulkier limbed remix of 'Swamp Tree' by Micahol from Thingverse: https://www.thingiverse.com/thing:4861749/files

I remixed the model so that it would:

- not require supports,
- so that it would be more resilient for tabletop use, and
- so that it would scale to the standard tabletop battlemap (~25mm base).
- I also made additional edits to extend the trunk, add roots to the base to make it more like a cypress tree.

I recommend adjusting the height between the trees when you print to give them some variety.

The base of the tree fits in a standard medium space and is relatively stable depending on how rambunctious your players are. That said I have

a based version as well. The tree on the based version is slightly smaller (80% scale) so that the roots fit on the base.

I recommend the version without the base as it really is just as stable.

Model files

terrain_tree_dead.stl

Main tree version that I recommend

terrain_tree_dead_based.stl

Based tree version. Unnecessary and I don't recommend it, but you do you. :)
