Like the original model, it's printable without generated supports, though you can choose to enable supports to avoid sagging bridges. I printed with a brim, but the brim may not be necessary if you have good bed adhesion.

After printing, remove the trigger's built-in supports marked in red in the following photos (ideally with flush cutters, but needle-nose pliers should work as well).

Changelog

2025-06-10

- reduced overall size to improve access to stick and buttons
- repositioned triggers to make them easier to press

2025-06-06
