The point of this project is to control Voicemeeter Banana - which is the audio mixer I use during my Twitch streams - with a physical controller. This version can control the gain of 5 channels, as well as toggle said channels to 2 outputs. It can be adapted and scaled up/down to suit different needs fairly easily.

Please see the GitHub page for the Arduino code, AutoHotKey scripts, and more information on how to put it all together : <https://github.com/tiphedor/ShlagMixer>
