I designed and 3D printed this minimalist soap dish to solve a common problem — soggy soap!
It features a built-in **drain channel** that allows water to run off easily, keeping your soap dry and lasting longer. The open design promotes airflow and prevents mushy residue buildup.

Printed using PLA on my 3D Printer, it’s lightweight, durable, and perfect for any bathroom or kitchen sink.

Functional, sleek, and easy to clean – a simple print that makes a big difference!
