When photographing competition models, I realized that lighting the model is very important. In order for your 3D model to look perfect, it is important to illuminate it well.

When photographing, I use my daughter's LED lamp - lighting from above and two LED light sources from the side.

- I created a simple tripod for them so that I could light at different angles.
- The tripod has an adapter for a **standard photo light - bayonet** and an **adapter for a 1/4 thread**.
- To connect the parts, you need an **M6 screw with a length of 16mm and a square nut M6 with a size of 10x10x3mm**
- If you are interested in other components, write, I will edit the model

When the screw is properly tightened, the legs move stiffly and the tripod stands firmly.

- **Link to buy LED lights - I am very satisfied with them:**
