### Summary

I used a different fan with the original design and it made a high pitched whine, so this design has a 3 mm gap.

---

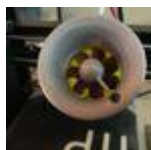

[3D Printers](#) > [3D Printers - Upgrades](#)

---

This is a very minor change to cmh's design. I just removed the 3 mm in front of the fan and it significantly reduced the noise. It is still plenty strong.

I printed in PLA+ with supports on the inside only, and annealed the print in my countertop air fryer. I left the supports on when I annealed it. It still warped slightly, but is very usable.
