Prelude

After I created the pad for my saltmill and it proved to fix the issue I had, I decided to make the version for peppermill also.

About

I didn't like that after mill was used and placing it back to counter/shelf, it will drop some pepper over the time and then it is all over the place. This small pad will help to catch most of if not all.

It is meant to be used just a pad where you land the mill to rest, it is not obviously meant to snap fit.

Details

Model of the peppermill that this is designed for is Peugeot Paris U.

Inner diameter for the mill is 62mm and it has little room to wiggle around to easily put the mill back on pad.

Created in Fusion 360.

Printing

I would suggest to use ironing to get nicer surfaces and hopefully having your printer tuned better than mine.

I printed this on Ender 3 Pro using black 3Djake ecoPLA.

Additional info

“Pepper” in Finnish is “Pippuri”.
