Summary

I decided to mod my zotac 3060 with 2 noctua 92mm fans. I designed this bracket specifically for that.

Tags: [mod](#) [bracket](#) [gpu](#) [noctua](#) [3060](#) [zotac](#)

This bracket allows the user to mount 2 noctua NF-A9x14 fans with 8 M3x16 screws to make the GPU a lot quieter.

I also suggest removing the backplate as it does not cool anything, but rather hinder cooling.

Please note that this mod requires some soldering knowledge as the user must change the connectors of the noctua fans with PHR-4 JST connectors.
