Summary

A SLAB catch pusher that pushes the catch perpendicular to the catch spring axis

[Hobby & Makers](#) > [Other Ideas](#)

This catch pusher V2 pushes the catch perpendicular to the catch spring axis. This sounds grand but it means catch pusher push down, catch go down. That's what we want. The regular catch pusher pushes the catch from off to the side which is all good for elastic bombastic low FPS times but I wanted to use a good 2.5mm 30mm OD spring from China as I'm as Aussie, can't get that shit anywhere but from China and i've spent all this time and effort making your imperial metrics metric. Hole is M5 spec. Double check your hole diameter so you don't get butthurt. Spring axis pic is legacy and spring catch pusher V2 is longer/wider than displayed. Which way do you twist? This is just the tip of the iceberg I have more coming just gotta sort it out
