Summary

A little prototyping station to test some arduino projects

Tags: [holder](#) [station](#) [arduino](#) [electronics](#)

I was making an arduino projet with plenty of cables and I faced the issue of the arduino drifting from the breadboard. I decided to make my own prototyping station

I know there is already plenty of version of an arduino holder but I needed one for the big breadboard, the arduino on the irght and a little tray to put some components so if you like it consider leaving a like and for any recommandation leave a comment
