Behold the PearTag, not a tracker but a contact card (or whatever you want it to be!)

So basically you take one of these (NFC stickers), pause the print and put it inside, then resume the print so it is embedded inside. Once the print is finished you can program your data to it with the free app NFC Tools on Apple or Android

I put my phone number and email on it so if it gets lost someone can tap their phone on it and get the data to contact you.

If the phone number or email isn't working a simple workaround is going to Google Drive , and uploading a .txt file with your info, then make the link available to Anyone With The Link, copy it, and write that to the NFC as a URL instead.

I included some "fresh" files without logos so you can use it for anything you want or in case you don't want the logos (I would not recommend

using the fresh ones for contact info because there are no instructions on the back and people wouldn’t know to tap their phone on it)

Finally I’m making this open source (can you do that with a 3d print?) so anyone can sell or improve it, hope you like the peartag lol

Ps. My CAD software got mad I didn’t pay them 300$ so they didn’t let me export in full quality, however you can’t really notice in the actual print so all good

Model files
