Bring iconic sci-fi history to your workbench with this massive **20.5" x 10.5" (52 cm x 27 cm)** replica of the Battlestar Galactica Viper Mark II! Truly an impressive showcase piece, this model captures the aggressive lines, triple-engine thruster assembly, nose-to-tail striping, and wing-mounted cannons of the classic Colonial fighter.

I wanted a standout multi-color project to test out my newly built **Prusa Core One INDX (8T)**, so I took Printerchick model (THANK YOU!), and spent the time fully colorizing and cutting the model right inside PrusaSlicer. I'm sharing the pre-colored files here to save you hours of

setup time! The model has been split to fit cleanly within the Core One build volume while keeping assembly straightforward.

Key Features

- **Massive Scale:** Measures **20.5" L x 10.5" W** for maximum display presence.
- **Pre-Colorized for INDX:** Formatted to save you the hassle of manual painting or tedious slicer coloring.
- **4-Tool Friendly:** Built on an 8-tool machine, but only requires **4 filaments/tools**, making it fully compatible if you're running a 4-toolhead setup.
- **Optimized Cut Layout:** Cut strategically to maximize build area usage and maintain structural strength.

Filament & Pro-Tips for the Best Look

- **Color Recommendation (Crucial!):** Avoid using bright white filament—it tends to make the ship look like a cheap plastic toy. Instead, print the main body in **Prusament Vanilla White** (or a similar off-white/cream shade). It gives the hull a weathered, authentic screen-accurate tone that looks wicked awesome right off the bed.
- **Material:** Standard PLA works perfectly.
- **Supports:** Print with "**Supports from build plate only**". This avoids burying delicate recessed areas in support material. You can easily touch up minor overhangs post-print with a quick pass of an X-Acto knife.
- **Assembly:** A little super glue or CA glue and you'll be all set!
