Tough storage box for UNO game cards.

A complete rework of https://www.thingiverse.com/thing:5217074

Initially, using raw filament as a hinge appeared to be a good solution.
However, over time, the filament became brittle.
Consequently, I replaced the two hinges with fully printed ones.
Additionally, I took the opportunity to store the cards vertically for easier handling.

- print instructions:
  For a tri-chromatic print, first print the "sign" part, followed by the "nosign" part.
  Ensure that two prints overlap and do not remove anything between the the two passes.
- assembly:
  For assembly, simply use brute force to snap the pieces into place.
