Mini **V10 engine fidget keychain** with fully functional moving pistons! The pistons move up and down when you rotate the gear, simulating the movement of a real V10 engine.

Designed for easy 3D printing and simple assembly. The mechanism uses a camshaft instead of traditional connecting rods and a crankshaft, making assembly easier while keeping the pistons functional.

Compact, satisfying to play with, and perfect for car enthusiasts, mechanics, and engine lovers!

Material: PLA (Silver, Gunmetal, or Metallic colors look best).

Assembly notes:

Short assembly videos on Instagram: **@artemix2006**

All printed parts fit tightly together after printing, ensuring a solid and stable construction.
