Summary

A simple bushing to take up slack in ORV swing arms

[Hobby & Makers](#) > [RC & Robotics](#)

I made these to replicate what I think was probably a CRP part at one time. This bushing goes in the hole in your transmission case and takes up the slop that the trailing arms usually exhibit. Not a new idea, but I wanted to use them in my latest builds. There are two sizes, as I found that one of my transmission cases had a smaller opening in it. The small one is around 11.5mm, and the larger is closer to 13mm.
