This table clamp is designed with a sturdier body, specifically intended to be clamped to a workbench so you can hold a board in a vertical position. It is also highly ideal for securing woodworking jigs to the table without restricting or interfering with your working area.

For the clamping mechanism, this model utilizes an M6 screw designed with a slight thread clearance to ensure smooth, binding-free movement. The end cap can be easily installed: simply thread the M6 screw all the way into the clamp body, then press the cap against the inside wall until it securely snaps into place.

To provide a firmer grip on objects, you can apply rubber pads or anti-slip material to the clamping surfaces.
