Features:

- **Modular** boxes store neatly into the **base game box** with the track boards. Some store on the side of the boards while others store on top
- Print what you need as you like. Depending on how you pack you can fit 7 side modules and 12 top modules
- Labels are for the base game (Pedal to the Metal) and the **3 expansions** (Tunnel Vision, Heavy Rain, and Rocky Roads) and include space for planned future expansions
- Space for the 3 announced expansions (if some of the track boards are stored in a separate box)

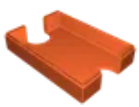

- **Quick setup**: player cards are stored in individual boxes, so just grab and go
- Unlabeled lids are available so you can easily **add custom text** (using slicer tools) to fit your needs
- **No hardware required**. Lids are a simple snap fit
- Lids lightly snap onto the bottom of each box for convenience

Printing instructions:

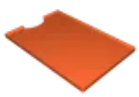

- If you don't have all 3 expansions or want to store cards in different groupings as I did, you can easily add custom text to the blank lid using built-in slicer tools
- If for some reason the snap fits are too tight or too loose, you can scale by +/-0.4% (simple) or adjust the XY contour setting (advanced)
- Print beds in the .3mf are laid out as individual modules pieces first and then pre-set box/lid combos. If you are printing my groupings, you can ignore the first 6 beds
- There is a separate "text" body for any part with a label, just make sure you import them with the corresponding lid/box, this way you can easily change the filament color of just that piece
- If you don't have a multi-material system you can print without the "text" body for simple embossed text. Or you can do the more involved method described in this video by Make Anything

Please let me know if you have any questions or suggestions. Happy printing!
