Updated, no more mesh defects!

I merged the single parts of the Extra 300 design by rhinodk into one (except the propeller) using Blender. That way it is printable with support but without the need of glueing the wings, which turned out very hard for me. The original creator stated that he had lost the hard drive on which the original files are, so this is probably the best model of this airplane that is currently available.

Make sure to print with the nose down and slice a few times using slightly different orientaions to see when you use optimal support.
