My wife hated when I would place the wet scrub brush over the side of the sink when I was done with the dishes and she hated it more when I would place the scrub brush in the sink ... so this was my solution.

Designed in FreeCAD with two hooks at 90-degrees which allows for more than one utensil or brush. The hooks are a bit fat (or is that Thicc?) to make them more durable.

It's a simple model and a quick print. No supports needed. I printed using PLA because I had gray PLA ... it would be better to print out of PETG. When I installed mine, it creaked a bit as it spread apart, but snapped into place. So far, after many months, we've had NO issues. PETG might give a bit better than PLA.

Your faucet diameter might vary, scale up or down to suit. My faucet has a small lip this rests against, yours might simply taper.
