I made some changes to Usuarius great Rust Auto Turret design to fit the Arduino Nano and all the cables inside, add a lid to the bottom and some more housing to the laser. It's now self contained and just needs a usb power source like a phone charger plugged into the base.

I originally printed this just to do a practice paint job for a different project but then I got a bit carried away :)

The lid might need to be printed at 98% scale if my memory serves me right.

There are probably differently sized laser modules and mine (cheap chinese one) seems to be a bit smaller than what Usuarius model was designed for, thus the two jackets for it to make it fit. I think it looks good with them though as it hides the cable and solder points a bit.

For assembly, connections and arduino code: <https://www.thingiverse.com/thing:3298689>

Update Dec 2022:

Added a base with hole for laser cable and a rotating shaft that has a proper hole for a screw to fasten it properly to the servo.
