## Summary

Improved the structural integrity of the MagHex with Center Mag.

V1.2:

- Changes interference to make it easier to initially engage magnets with larger chamfer.
- Switched to derived design in Fusion 360 so that all changes to the base model will update other models.

V1.1:

- Updated models to match the parametric design from original design.
- Added model for water with solid bottom for resin pour.

---

Improved the structural integrity of the **MagHex with Center Mag** as I found the model this was breaking when inserting the center magnet. I believe this uses less material than the original **MagHex** on thingiverse so I suggest just printing these for all maghex hexes.

I started with printing the original **MagHex** versions from thingiverse. This model is a significant improvement from bed adhesion to magnet retention. I highly suggest using this over the original model. Learn from my mistakes.
