Remix of @JLCURTIS excellent Biqu H2 mount, this time for the Ender 5 Pro.

<https://www.thingiverse.com/thing:4889163>

This remix shifts the Biqu H2 by 13mm on the X axis to reclaim some print bed space. I've increased the BLTouch mount clearance as it was still impinging on the drive belt crimp. I've also added another mounting screw as the centre mass has moved further away from the original mounting screws and was causing the mount to flex. I've also made one or two other minor tweaks.

To drill the hole then remove the Ender 5 Pro carriage plate and use the new mount to mark and drill the new 3mm hole. Its quite tight on the X Axis homing switch so just watch that and adjust as required.

The added benefit of this remix is that it increases the clearance between the BLTouch and the cooling fan, hopefully giving improved air flow.
