A cover to keep the umbrella hole in the [Godox AD-R6 7" Bowens Mount Reflector](#) from leaking light when an umbrella is not being used. Print it in TPU and then just snap it into place.

I figured this would be easy to lose, so there are 3 versions:

- The ring version has a line attaching it to a ring. The ring can be stretched over the narrower end of the reflector. When you remove the cover, it will hang from the reflector instead of getting lost. This is the version I use and recommend. The others only exist because I thought of this one last.
- The hole version has a hole so you can use string to tie the cap to the reflector to keep it from getting lost.
- The plain version is for people who like living dangerously. Don't ever take the cover off. You will lose it.

Model files

plain.stl

with-hole.stl

☐ Includes hole so you can tie it to the reflector

with-ring.stl

☐ Includes a built in ring to keep the cover tethered to the reflector
