Summary

Makes soldering easier

[Hobby & Makers](#) > [RC & Robotics](#)

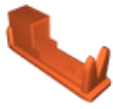

I got tired of fighting to keep the plug and wires in place while soldering everything together so I created this little holder to help.

When I do my soldering I always keep the male and female together in case things get a bit hot. That way the pins always stay in place and don't shift. The plug just slides into the box and either or end will fit in nicely. You can temporarily tape your mount and battery in place to prevent movement and once done simply peel the tape off and remove your assembled part.

I printed it with generic PLA @ 15% infill. Support is not required

The letters are raised and easily marked with a Sharpie as I've done or print in multiple colours.
