A question block originally made by **Matt Sauer** (Forehead), which is a great design by itself and is truthful to the 8-bit inspiration, remixed with three adjustments:

- Made it 8 times larger (twice the length for each axis)
- Separated the question-marks from the rest of the cube to make it printable with 2 materials/colors (I personally chose red for the box and white for the question-marks)
- And with the coin-slot size is corrected for the largest Kuwaiti-currency coin (100 fils).

This is a present from me to my eldest son for losing his first tooth :)

Updated 25-09-2016:

- Separated the box and lid into several files, for convenience.

- Made the box wall a little thinner without compromising structural integrity, to save time and filament.
- Corrected the size of the coin-hole.
- Corrected fitment of lid.
- Corrected the lid platform so that it doesn't string without supports.

Print Settings

Printer:

BCN3D Sigma

Rafts:

No

Supports:

No

Resolution:

0.3mm

Infill:

15%, straight lines

Notes:

- Printed the cube with e-Sun PLA (i.e. regular PLA), with the hot-end temperature at **215c**, and the bed at **60c**.
