I pretty universal game controller wall mount.

Designed it so that the controllers would not touch the wall itself, only the wall mount. (which is the case for most of the controllers)

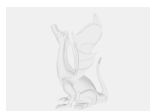

Apart from that I wanted it to be seen as little a possible, hence the 2 pronged design, angled downward. Apart from the 2 hooks on the front, most of the wall mount should not be visible when holding a controller. Works with almost all of the controllers I have at my disposal. (check the pictures)

Generally controllers with a flat middle will work fine.

The xbox 360 controller is a bit risky, as the battery pack on the back interferes with the design, the same goes for the 'drums' of a DS3 and a

DS4. The Dual Sense (PS5) controller works fine.  
To add a bit of friction to the wall mount, some O rings switch dampeners can be used.
