Summary

Replacement part for my broken GU Ferco window roller keep E19221 but other references also work.

The best filament for printing is **Nylon** as original, but I guess filament like **ASA/PC** also works well.

I printed in PETG to test the resistance (and because I don't have a stronger filament ^^), after several months there doesn't seem to be any abnormal wear so I decided to post the file.

It is necessary to print the object with supports, I advise you to print it as on my picture to keep pretty visual aspect on visible side.
