### Summary

Measure awkward spaces behind things that poke out using only your basic ruler or regular vernier calipers :)

Both the large and straight jaws move together and always have the same gap, allowing you to use a ruler or vernier calipers to make the measurement of some awkward places without guessing.

I designed these to measure the thickness of my door panel with a cat flap in it; the cat flap is very thick and deep, so regular vernier jaws did not do the job

You could scale this up to use other hardware, default is a 3mm pivot pin:  
105.8% = 1/8" (3.175mm)  
133% = 4mm  
166% = 5mm

I have provided a .step file if you would like to remix this tool (add measurement indexes, a locking mechanism or a spring perhaps?).  
Designed using the fantastic FreeCAD v.0.20.1

Added a ready to gcode file generated with PrusaSlicer for Prusa MK3's  
with PLA filament
