Summary

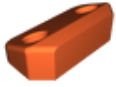

The standard magnetic door latches on the Voron V0.1 have the screws too close together for utilizing no drop nuts.

The standard magnetic latches on the Voron V0.1 have screw holes too narrow for utilizing no drop nuts in the frame. Unfortunately you make the decision to use no drop nuts early in the build and it is very difficult to undo their use when it is time to install the door. This part is designed with screw holes wide enough for using no drop nuts while keeping the magnets at the same place for the handle. I have also made sure that this does not interfere with the Fysetc Voron V0.1 kit door which uses screws to hold the door handle in place instead of VHB tape.
