Clips to hold the Mystic Circuits 0HP Modules to a Eurorack rail. There are two versions - the front-mounting clip and the rear-mounting clip. They can be alternated to avoid collisions between the cables. The front-mounting clip takes up 12HP. The rear-mounting clip uses at least 6HP, but you should allow more like 12HP for cable clearance and clearance behind the rail.

The rear-mounting clip should be printed with 100% infill for increased strength. I haven't had any problems with the front-mounting clip using 15% infill.
