Summary

The Dodecahedron Reverse Engineering Marker is a tool used for reverse engineering and 3D scanning of complex objects.

[3D Printers](#) > [Accessories](#)

The Dodecahedron Reverse Engineering Marker can also be used for 3D scanning applications. By placing the marker around the object to be scanned and using a 3D scanner to capture data through the holes in the marker, the resulting 3D scan can be more accurate and reliable.

The marker helps to ensure that the scanner captures data from multiple angles and directions, resulting in a more complete and accurate representation of the object being scanned. The use of a marker can also help to reduce errors and inaccuracies in the scanning process, particularly for objects with complex geometric shapes.

Overall, the Dodecahedron Reverse Engineering Marker is a versatile tool that can be used for a range of applications, including reverse engineering and 3D scanning. Its unique design and multiple-sized holes make it a valuable asset for those seeking accurate and reliable measurements of complex objects.
