### Summary

Simple dog tag with a build in loop for attaching it to the collar/harness.

[Household](#) > [Pets](#)

I have a pretty active dog named Shadow and I don't like when something rattles when she run around. Also I had previously simple dog tag clipped on to the small metal ring but sometimes a leash got clipped to it by mistake and it would break.

I was thinking what would be the best way to have some dog tag on my dog which would be quiet and harder to loose. So I came up with the idea to use TPU and make a big loop which you could loop through a dog tag itself and this way attach it to the harness.

It works surprisingly well. I was worried it would break or something (because it sticks out a bit) but it's attached to Shadow for a few months now and still doing fine. On mine I have my number debossed on the back side but I did not want to share it.
