<https://dutchdevelop.com/bl-led-controller>

Final V2 Has USB Cutout for firmware and Pins Named correctly to WW and W

--Note Check the Wiring on the cable, next to the LEDS it says the letters, for me Green and Blue were opposite from the actual wiring colors

--NOTE Warm is WW and Cold is W

PETG or PLA printing is good, PLA will bond to PETG,

The gold is in PETG Prusament

PETG is in Gold Blue and Black

PLA is in red and green

all items layer in good printing orientation

Note coloring is on the bed side so less purge is created
