Combined a couple of great models that enabled me to mount my ThermPro TP50 on my Skadis setup.

This is my first time using the T-Clip system by Line Arc Line and it worked like a charm. I am sure I'll be using it again.

I printed this on one plate in about 2.5hrs at 0.15 layer height and 25% infill for all parts. They are plenty strong enough and it has been working in place for a while now.

I have included a fixed STL of the holder as the .obj provided by Psycho Shaft needed repair. I've also included the mount I designed but suggest you visit Line arc Line's model to get the mounting clips as there are a couple of versions depending upon the skadis you chose. Leave them both a review as well as the they both did most of the hard work on this.

Please leave a picture and rating if you print this, I love seeing people print the things I upload.

Thanks to the original creators of these parts and for sharing them with a license that allows me to share my version with you as well.
