updated 7. 4. 2023 | published 7. 4. 2023

Summary

My old mouse (Zelotes C12) had a broken scroll wheel, so I decided to design a replacement.

I printed mine with PLA, you might want to use PETG for better durability (the axle could use some elasticity and better layer adhesion), but also for it's transparency (LEDs don't really shine through matte PLA). I also added a picture with dimensions.

Print with the larger axle on the plate (supports required).
