This is a tire for a irobot Braava Jet M6 robot mop. My tires wore out, and it was creating problems with docking.

I printed it in TPU with no supports on a prusa mini+.

Protip: boil the TPU tire (not the wheel) in water to add a little flexibility to the tpu to aid in installation. Do not boil the wheel, it will warp.

Installation is pretty simple. Pry the old tire off of the wheel - press the new (warm and flexible) tire onto the old wheel.

EDIT: I added the fusion 360 file. I'm a complete novice, so pardon my design skills.
