I'm excited to introduce you to the **Flexetki**. A **fidget and skill toy** that takes advantage of 3D printing and gives you a fully functional skill toy with **no assembly or post processing**. Just print, take it off the build plate and you're good to go!

The Flexetki is **inspired by various prayer beads** from all around the world (e.g. kompoloi, misbaha, chetki, mala, begleri, ...), which were primarily used for praying in the past. In recent years, the **skillful manipulation** and development of **tricks** has almost become a kind of sport and now inspires a large number of people.

You can use the **Flexetki** as a simple hand candy and fidget toy by sliding the chain links through your hands or you can take the next step and learn advanced tricks and routines.

I'm not particularly good at it myself but still have a lot of fun with various forms of this type of skill toy. Feel free to watch videos on the subject,

learn your first tricks and report in the comments if you like my design. I would be happy to share this hobby with the maker community and maybe welcome some of you to the world of skill toys.

Printing Tips:

For **optimal weight distribution** I recommend using 100% Infill.

Have fun! :)

This is the 2nd design in this row of toys - If you like it also check out the first design: <https://www.printables.com/de/model/502567-flexetki-skill-toy>
