They say one shouldn't cry over spilled milk. Spilled resin? A whole other thing. I mean it gets... everywhere.

Silicone funnels are super useful for resin printing. The problem is they are floppy. Here is a hands free solution to the "empty your print vat through your easy to clean but hard to support funnel into a small mouth resin bottle" problem.

The funnel is skeletonized to reduce weight and material. It features a flared flange at the bottom that helps keep it stable. I've had pretty good luck with this, so far. Just thought I might share it.

Please let me know what you think. Thank you for your support.

### Print Settings

**Printer Brand:**

Prusa

**Printer:**

I3 MK3S

**Rafts:**

No

**Supports:**

No

**Resolution:**

.03

**Infill:**

10%

**Filament:** N/A PETG N/A
