### Summary

A small bracket to allow mounting of a small camera, like a GoPro, onto an Arrow tracking antenna

If you've ever had your hands full at a launch with your tracker in one hand and your yagi antenna in the other, but also wished you were somehow recording video, have I got the small 3d-printed object for you! This thingamajig just attaches onto the end of your antenna (specifically, one from <http://arrowantennas.com/>) and holds a camera for you, recording all the exciting stuff that is happening in the exact direction you're pointing the antenna.

Note: this bracket just has a 1/4" hole on the end - you will need to use your camera's own bracket to attach to it.
