## Summary

Skadis boards are cool. The Universal Hook is cool. But how about a thing to hold a thing?

[pegboardhook](#)

**Fits [the Skadis Universal Hook](#) by CSD\_Salzburg.**

It's 1AM here, so I'm going to be 80% less funny than in my other model descriptions. That's OK. None of you can read anyway. (You? You're Wordsy Georg and should not be counted.)

Anyway: I really like the [Skadis Universal Hook](#) design. Being able to use an interference fit to lock holders and other stuff to a [Skadis pegboard](#) is nice, but building the actual holder is a bit of a pain - there are other universal hook catches out there but you have to design your piece around the need for it to attach to the hook at an angle and pull downward. Sometimes that works; sometimes you want to open-palm slam a thing to your pegboard and pull it down.

For those brutish times, consider this one. Single catches are probably generally the best, as you can build your holder around them, but double/triple/quad catches are provided for completeness.

Also, there are STLs. I guess if you want to test your slicer settings? I don't know. Use the STEP or F3D files like you mean it or something.
