Summary

A set of universal spur gears as a base for user modifications with slicer functions only. No CAD required!

Object Description:

This is a collection of spur gears with a pressure angle of 20°, module = 0,9 and 12 to 40 teeth.

You can easily modify this basic models for your needs with slicer functions only.

For example:

- all models are 5mm thick. You can modify it by changing the Z-value only.
- add a round bore hole by adding a cylinder as a negative volume.
- add a square bore hole by adding a cube as a negative volume.
- add a elliptical bore hole by adding a cylinder with different X and Y values as a negative volume.

- add a recess by adding a positive volume.
- add a round bore hole in horizontal direction for a thread insert, that you can fix the spur gear with a screw.
- these are just some examples. More modifications are possible and depends on your fantasy and your needs.

Very important notes. Please read before print:

- All models will be automatically loaded with one tooth showing exactly in positive Y-direction.
- **Please note that all spur gears with an uneven number of teeth will be loaded slightly out of its center to the print plate center.**
- **For this reason it is absolutely necessary that you correct its position to the print plate center right after the import before you start adding positive or negative volumes.** Otherwise this additional volumes will be slightly out of center.
- Assuming that a pre-correction by me will fail with the use of other slicers than Prusa Slicer, I have provided a table with correction values for all provided spur gears in the download section.
- **Please move the model by this value in positive direction first.**
- If you are not sure in which direction you should move it, load the test piece and add a positive cylindrical volume of dia. 6mm to the middle of the print plate, and have a look to the gap of the bore hole with dia. 6.1mm. This test piece must be moved by 0,151mm in Y-direction to be in the middle of the print plate.

Calculation of the center distance:

- a = center distance [mm]
- z_1 = number of teeth of spur gear 1
- z_2 = number of teeth of spur gear 2
- m = module
- **Formula: $a = (z_1 + z_2) * m / 2$**

- Gear Rack Collection, alpha = 20 deg, different modules: [Gear Rack Collection](#)

If you need a version not available in the download section, don't hesitate to contact me.

Print settings:

Material: For best function Nylon is recommended, but PETG, PLA, ABS/ASA does also.

Layer height: 0,15-0,30mm, depending on your application

Nozzle diameter: 0,4-0,6mm, depending on your application

Infill: 20%-100%, depending on your application

Perimeters: 2-X, depending on your application

Brim: no

Support: no
