Voron V0.2 Fan Skirts

This mod is to add extra cooling under the plinth so helping to keep you Z axis motor and Power supply cooler.

Pease Note, this mod will not fit the R1 Release. if you want the fan mod for these skirts you can find them here <https://www.printables.com/model/508787-voron-v02-r1-skirt-fans>

I have done two different versions of this.

V1 has wire holes in the side to allow for OEM wire exit

V2 has no wire holes to those who want to run the wires straight out the back

UPDATE

There is now a V2 fan cover. this design should help reduce fan noise.

UPDATE 2

i have added a second set of fan covers that should provide a tighter fit if the standard versions are a bit loose. these will be labeled as TF after the cover name.

Printed with standard Voron Print Settings.

5 Top and Bottom

4 Perimeters

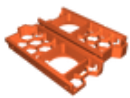

40% infill

happy printing!

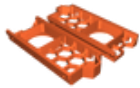

don't forget to upload your make of this mod!

any feedback will be awesome!
