Summary

Something to help stabilize the SATA ports on an inexpensive M.2 / NVME form factor SATA host bus adapter.

I picked up an M.2 / NVME SATA adapter to use in a mini-pc and the SATA sockets seemed a little flimsy. I was concerned that they could be damaged by small tugs on the SATA cables over time so I designed a bracket to provide a little extra support. My particular board is a 5 port JMB585 m.2 form factor adapter.

This is a pretty crappy model that I threw together in Tinker CAD so be forewarned. But it's working for me and I thought I'd share.
