I bought a Cooler Master case for my framework mainboard. It works great, the problem is that the rubberised stand started to have problems after less than a month. While i hope that cooler master will replace it, i decided to make one in the meantime, and improve on it. I added a slot for [a USB C hub](#) that i use with the case.

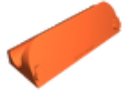

I printed this in TPU with 0.2 profile on my Bambu P1P. I think it turned out pretty well. Hope this works for you! Feedback appreciated!

added one for an ethernet dock, specifically this [ugreen one](#)
