I've updated the extruder and z-axis on the ender 3 quite a few times but it's gotten to the point where they started to interfere with each other.

For this reason I have designed this side mount, it allows to mount the original motor with a vibration damper, a heatsink and a BMG extruder without interfering with the Z Anti Wobble.

The file is in the optimal orientation, I have used 30% infill.

Note: In the photos the motor is installed incorrectly, it must be rotated 180 degrees.
