Summary

I needed a more "flush" extrusion cover for my Voron 2.4 and "EnderWire" so I made this

[3D Printers](#) > [3D Printers - Upgrades](#)

Tags: [extrusion](#) [cover](#) [2020](#) [2020extrusion](#)

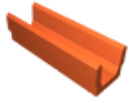

I needed an extrusion cover, having loose filament fall into the extrusions really annoys me. I found plenty on printables, Voron mods, and Thingiverse however none of them really fit my extrusion rails hence this project.

****The extrusion covers are meant to be used with Metric Aluminum Extrusion rails that do not have "V" cuts like ender printers do.****

Easy to use, simply drag and drop the .stl into your slicer unlock the dimensions and make the Y whatever length you need.

To have multiple lengths printed at a time you need to drag and drop the .stl back on your slicer's build plate.
