Dentist tool, also known as Sickle probe or Dentist Explorer is very important tool in a workshop! For example if you need to remove small and tight rubbergasket without damaging it, this is the only tool that can make that happen! Okay, maybe it's not that important tool for everyone, but I could not live without it, so I have two.

I made this holder to have easy and fast access to it, and that tool can't just sit around with rest of your tools, the pointy ends are really really pointy!

Made with Microsoft 3D builder, also included is 3mf file if you need to change it anyway.

Biltema pegboards are sold in Scandinavia, but pegboards with same measurements are all over the world and you can attach this with two screws to anywhere.

## Print instructions

Use 5 walls to get sturdy thing, it doesn't change filament usage much and increases print time only 5 minutes. Set support angle 70%, you only need little supports and it might print fairly well even without them. This takes 6 meters of filament (18g) and with 60mm/s takes 1h46min to print.
