After upgrading my P1P to a P1S I found my previous mount for my WyzeCam would no longer be useful. This solution enables you to still monitor your prints without worrying about opening or closing the door depending on the material being printed.

Example pictured is printed at default .2 layer height settings with supports enabled.

Once printed, the bottom inserts can be used for either adhesive rubber in order to keep it non-slip but removable, or Medium Size Command Strips if you'd like a more semi-permanent solution(I haven't tested Command Strips yet, but the dimensions are correct per their description). I've opted for the non-slip rubber, and have included a small template in the files to help you cut out the correctly sized strips. I traced the template then used scissors to cut them out. Please trace the inner outline of the template for the correct size.

Adhesive Rubber used. (I've found its come in handy for other projects as well)

Simply place the mount on the top glass of your P1S, and it should slot right on top of the silver handle.

Obviously you will not be able to remove the top glass and use the camera at the same time, but if you're like me and have your AMS top mounted, it won't be a common thing anyway.

Please feel free to let me know if you have any issues with the model.

If you found this model useful, please consider buying me a [beer](#), thanks!
