Modeled from scratch, inspired by lwx007's design: Thingiverse #5685812

I saw some comments about difficulties with the original model requiring assembly or gluing, and decided to make a model that can be printed in a

single piece and without any support, since PETG doesn't handle supports well.

- Two sizes available:
  - Small → for small berries, small leaves, and small portions of grapes and cherry tomatoes
  - Large → for larger salad leaves and larger berries, or large portions of grapes and cherry tomatoes
- Works better in PETG (PLA may leak)
- The walls are made thin to save material and print fast, but it's perfectly strong in the default sizes. Be careful when resizing the design
- If your sink has low flow, you may need to block some of the drain holes

Made on Onshape.

Step files included.
