Summary

remix of the sculpture with a tube to connect it to a hose with flowing water in order to make her part of a fountain

The challenge is to make Jeanneke Pis part of a fountain and actually have her let waters go the natural way.

The upstream model already has the plumbing with water ducts going up from the socket, one in each of her legs and recombining inside her in her pelvic area.

I added a tube at the opening on the back of the socket so a hose can be connected. It works almost, meaning in the original print size everything is so small that the figure, even in finest resolution, has no opening to let the waters out and there's merely some slow drops of water forming at her butt that resemble incontinence more than a proper pee.

I'll have to try it again at 170% - 200% print size...
